# 1. APPLICATION

NA5 series meters with multicoloured bargraphs have an universal input destined to measure temperature, resistance, voltage from shunts, standard signals, d.c. voltage and d.c. current.

They can find application in various industrial fields, e.g. food industry, intermediate pumping stations, sewage treatment plants, chemical industry, weather stations, breweries.

They are destined for the visualisation of the measured value and evaluation of change trends of checked technological processes. They can also find application in automation systems where programmed controllers are applied.

Fig.1. View of the NA5 meter.

NA5 meters can have in option: a continuous analogue output, a relay output, open collector (OC) type outputs and an RS-485 digital output.

They are programmed by means of the keyboard and through RS-485.

NA5 meters realise following functions:

- measurement of the input quantity and displaying it on the display and the bargraphs,
- recounting of the input signal into indication on the base of the individual linear characteristic,
- arithmetical functions: raising to a power, extraction of roots,
- programming of colours and bargraph resolutions,
- signalling of alarm value setting exceedings,
- recording of the measured signal in programmed time segments,
- storage of maximal and minimal values,
- programming of the measurement averaging time,
- programming of the indication resolution,
- deadlock of the parameter introduction by means of a password,
- conversion of the measured quantity into a voltage or current output signal,
- service of the RS-485 interface in MODBUS protocol, both in ASCII and RTU mode.

## 2. SET OF THE NA5 METER

We deliver in the set:

| - NA5 meter                                   | 1 pc.                               |
|---|-------------------------------------|
| - user's guide                                | 1 pc.                               |
| <ul> <li>plug with screw terminals</li> </ul> | 1 or 2 pcs (depending on execution) |
| - holders to fix the meter in the panel       | 2 pcs                               |

When unpacking the meter, please check whether the type and execution code on the data plate correspond to the order.

# 3. BASIC REQUIREMENTS, SAFETY INFORMATION

Symbols located in this service manual mean:

#### WARNING!

Warning of potential, hazardous situations. Especially important. One must acquaint with this before connecting the NA5 meter. The non-observance of notices marked by these symbols can occasion severe injuries of the personnel and the damage of the instrument.

#### CAUTION!

Designates a general useful note. If you observe it, handling of the meter is made easier. One must take note of this when the instrument is working inconsistently to the expectations.

#### Possible consequences if disregarded !

In the security scope the meter meets the requirements of the EEC Low-Voltage directive (EN 61010 -1 issued by CENELEC).

#### Remarks concerning the operator safety:

- Non-authorized removal of the required housing, inappropriate use, incorrect installation or operation creates the risk of injury to personnel or damage to equipment. For more detailed information please see the user's guide.
- All operations concerning transport, installation, and commissioning as well as maintenance must be carried out by qualified, skilled personnel and national regulations for the prevention of accidents must be observed.
- According to this basic safety information, qualified, skilled personnel are persons who are familiar with the installation, assembly, commissioning, and operation of the product and who have qualifications necessary for their occupation.

#### 2. Transport, storage

Please observe the notes on transport, storage and appropriate handling. Observe the climatic conditions given in Technical Data.

#### 3. Installation

 The NA5 meter must be installed according to the regulation and instructions given in this user's guide.

- Ensure proper handling and avoid mechanical stress.
- Do not bend any components and do not change any insulation distances.
- Do not touch any electronic components and contacts.
- Instruments may contain electrostatically sensitive components, which can easily be damaged by inappropriate handling.
- Do not damage or destroy any electrical components since this might endanger your health!

#### 4. Electrical connection

- Before switching the meter on, one must check the correctness of connection to the network.
- In case of the protection terminal connection with a separate lead one must remember to connect it before the connection of the instrument to the mains.
- When working on live instruments, the applicable national regulations for the prevention of accidents must be observed.
- The electrical installation must be carried out according to the appropriate regulations (cable cross-sections, fuses, PE connection). Additional information can be obtained from the user's guide.
- The documentation contains information about installation in compliance with EMC (shielding, grounding, filters and cables). These notes must be observed for all CE-marked products.
- The manufacturer of the measuring system or installed devices is responsible for the compliance with the required limit values demanded by the EMC legislation.

#### 5. Operation

- Measuring systems including NA5 meters must be equipped with protection devices according to the corresponding standard and regulations for prevention of accidents.
- After the instrument has been disconnected from the supply voltage, live components and power connections must not be touched immediately because capacitors can be charged.
- The housing and the door must be closed during operation.

#### 6. Maintenance and servicing

Please observe the manufacturer's documentation.

Read all product-specific safety and application notes in this user's guide manual

- Before taking the meter housing out, one must turn the supply off.
- The removal of the instrument housing during the guarantee contract period may cause its cancellation.

# 4. INSTALLATION

## 4.1. Fitting

Prepare a  $(44^{\circ0.5} \times 137.5^{\circ0.5})$  mm hole in the panel. The thickness of the material from which the panel is made should be in the range 1...45 mm.

The meter has screw terminal strips which enable the connection of  $2.5 \ \mathrm{mm^2 \ cross}$  section external conductors.

Meter dimensions are shown on the fig. 2.

Fig. 2. Meter overall dimension

## 4.2. External connection diagrams

The description of terminal strips are shown on the fig. 3a.

Connections of input signals are shown on the fig 3b and output signals on fig. 3c and 3d.

The meter has programmable inputs. Maximal measuring ranges are given on figures.

b/ Connection way of input signals

c/ Connection way of digital and analogue output signals depending on the execution code

#### Fig.3 External connections of the NA5 meter

Taking into consideration electromagnetic interference it is recommended to use shielded conductors for the connection of input and output signals.

The power supply must be connected by means of a two-wire conductor with a suitable cross-section ensuring its protection by means of an installation fusible cut-out, in case of a short-circuit. Requirements concerning the supply cable are regulate by EN 61010-1 p.6.10 standard.

# 5. SERVICING

After connecting external signals and switching the meter on, its name  $\Omega R-5$  and also the current version of the program, e.g.  $\sigma$  100, are displayed.

After ca 3 seconds, the meter transits automatically into the working mode in which it carries out the measurement and the display of the measured value on the display and the bargraph.

Depending on alarm parameter settings, the resolution and bargraph type, alarm thresholds are also displayed on the bargraph.

The meter blanks automatically insignificant zeros.

#### Key functions:

Fig. 4 Description of the NA5 frontal plate.

- acceptation key

- entry into the programming mode (hold down during ca 3 seconds),
- entry into the chosen parameter level,
- entry into the changing mode of the parameter value,
- acceptation of the changed parameter value.

- Key to increase the value

- display of the minimal value (first pressure), maximal (second pressure), return to measurement (third pressure),
- mowing on the preview menu or programming matrix,
- change of the chosen parameter value increasing of the value.

# - Escape key

- entry into the menu of recording results,
- entry into the preview menu or programming matrix,
- exit from the preview menu or programming matrix,
- escape from the parameter change.

The pressure and hold down the key during 3 seconds causes the entry into the programming mode. The programming mode is protected by the **5***EC* safety code.

The pressure and hold down the key during 3 seconds causes the entry into the preview menu and the menu of recorded values. One must move on the preview menu by means of the key. In this menu, only all programmed parameters except servicing parameters, are accessible to readout.

The exit from the preview menu is operated by means of the  $\bigcirc$  key. It is also possible in the preview menu to review recorded r ESL values.

The pressure of the key on the  $r \in SL$  parameter causes the entry into the pre-

view menu of recorder values. The recorded result number is displayed alternately with the value e.g.  $\sigma 320/2$  174.

The moving on recorded values follows by means of the  $\bigtriangleup$  key. The pressure of this key longer than ca 2 seconds will cause the acceleration of the review. The pressure of the key in any moment will cause the lighting of the number of recorded results. The exit from the review of recorded values is operated by means of the  $\fbox{}$  key. The algorithm of the meter servicing is presented on the fig. 5.

The appearance of the following symbols and inscriptions on the display means:

Fig 5. Servicing algorithm of the NA5 meter.

It is possible to change meter parameters:

- from the meter keyboard ( p 5.1)

Incorrectly introduced safety code

Exceeding of the upper measuring range or lack of sensor

Exceeding of the lower measuring range or short-circuited sensor

Error of the conductor resistance compensation. No connected conductor or damaged conductor.

- through RS-485 (p.6.)

# 5.1. Change of the NA5 meter parameters from the keyboard

The pressure of the key during circa three seconds causes the display of the **SEC**.

Inscription alternately with the set zero value by the manufacturer. The introduction of the correct code causes the entry into the programming mode. The fig.6 represents the transition matrix into the programming mode. One can move on groups of main parameters eg: **Ch1**, **Ch2**, **bAr1**, **bAr2**, **Al1**, **Al2**, etc, by means of the **(**) key.

The pressure of the  $\checkmark$  key on the given level, causes the entry into parameters of this level. The moving on the given level is operated by means of the  $\blacktriangle$  key.

In order to change the value, one must use the 🗲 key. In order to escape from the parameter change, one must press the 🕞 key.

By means of the *(***p**) key, one can exit from the selected level and programming matrix to the measurement.

# other characteristic points are calculated

#### Fig. 9. a) Individual characteristic of the display, b) Individual characteristic of the analogue output.

Fig. 10. Bargraph modes.

## Notice!

- The meter is working in the measuring range of defined indications by the user in LoIn and HiIn parameters. Below and over, it shows a range exceeding.
- In case when the meter is working with a resistance thermometer in a twowire system, the choice of the automatic compensation option of conductor resistance changes will cause a defective meter operation and the display of ErrC inscription.
- In case of the display individual characteristic switching on, the result on the display is linearly converted according the introduced parameters: I\_H1, I\_H2, d\_Y1 and d\_Y2.
- In case of arithmetical functions and individual characteristic switching on, in the first sequence, arithmetical operations will be carried out and the obtained result is converted by the individual characteristic.
- In case of the analog output individual characteristic switching on, the measurement result is linearly converted according to the introduced parameters: d\_H1, d\_H2, O\_Y1 i O\_Y2.

- The meter currently checks the value of the introduced parameter at the moment. In case when the introduced value exceeds the upper or the lower range of changes given in the table 1, the meter will not make the parameter record.
- In case of the Input type change, a simultaneous change of the decimal point follows, optimally for the given input.
- After the supply decay, the current time is reset.
- The recording switching off follows in following cases: switching the recording off from the programming matrix, change of the **input type**, change of the **recording time start** or the **recording time interval**, setting **Cnt=**0, filling of the memory, and at a renewed switching of the meter on to the network.
- In case of a Intr or Sect bargraph type, it is possible to set only one CurL and Curh markers (from one alarm). The others are automatically erased.
- Max and Min values are erased in case of changes: input type, individual characteristic (on, off), writing of standard parameters.

#### 6. RS-485 INTERFACE

Standard parameters of the NA5 meter

Table 2

| Parameter description | Standard value          | Parameter description | Standard value     |
|-----------------------|-------------------------|-----------------------|--------------------|
| 64P                   | ሳሳ <b>ቶ</b> ሬ (± 40 mA) | Pri                   | - 20.00            |

NA5 programmable digital meters have a serial link of RS-485 standard to communicate in computer systems and with other devices fulfilling the master function. The MODBUS asynchronous character communication protocol has been implemented on the serial link. The transmission protocol describes information exchange procedures between devices through the serial link.

### 6.1. Procedure of the serial interface connection

The RS-485 standard enables the direct connection to 32 devices on a single serial link up to a 1200 m distance. For the connection of a higher number of devices it is necessary to apply additional intermediate-to-separating systems.

The exit of the interface line is presented in the service manual on the fig. 3.d. In order to obtain a correct transmission it is necessary to connect lines A and B in parallel to their equivalent lines in other devices.

The connection must be made with a shielded conductor. The shield must be connected to the protective terminal in one point.

The **GND** line serves to the additional protection of the interface line at long distance connections.

One must connect GND signals between devices and in one point to the protective terminal (that is not necessary for the interface correct operation).

To obtain the connection with the computer of IBM PC class, an RS-232 into RS-485 converter is necessary or an RS-485 interface card. The way of NA5 meter connection through the PD5 converter is shown on the fig. 3d.

The designation of transmission lines for the card in the PC computer depends on the card producer.

#### 6.2. Description of the MODBUS protocol implementation

The implemented protocol is compatible with the PI-MBUS-300 Rev G Modicon

Company specification.

Set of serial link parameters of meters in the MODBUS protocol:

| <ul> <li>meter address</li> </ul>         | - 1 247                   |
|---|---------------------------|
| baud rate                                 | - 2400, 4800, 9600 bit/s  |
| working mode                              | - ASCII, RTU              |
| <ul> <li>information unit</li> </ul>      | - ASCII: 8N1, 7E1, 7O1    |
|   | - RTU: 8N2, 8N1, 8E1, 8O1 |
| <ul> <li>maximal response time</li> </ul> | 500 ms                    |

The configuration of serial link parameters is described in the further part of the user's manual. It consists on the establishment of the baud rate (**bAud** parameter), device address (**Adr** parameter) and the type of information unit (**trYb** parameter).

#### Note:

Each meter connected to the communication network must have:

- a unique address, different from addresses of other devices connected in the network,
- an identical baud rate and information type.

#### 6.3. Description of the MODBUS protocol functions

Following functions of the MODBUS protocol have been implemented in NA5 meters:

Table 3

| Code      | Meaning                            |
|-----------|------------------------------------|
| 03 (03 h) | Read-out of n-registers            |
| 06 (06 h) | Recording of a single register     |
| 16 (10 h) | Recording of n-registers           |
| 17 (11 h) | Identification of the slave device |

The maximal number of registers for writing or readout by one order is equal 28.

#### Read-out of n-registers (code 03 h)

Function is inaccessible in the publication mode.

Example: readout of 2 registers beginning from the register with the address 1 DBDh (7613) in RTU mode.

Request:

| Device<br>address | Function | Register<br>address<br>Hi | Register<br>address<br>Lo | Number of<br>registers<br>Hi | Number of<br>registers<br>Lo | Check-<br>sum<br>CRC |
|-------------------|----------|---------------------------|---------------------------|------------------------------|------------------------------|----------------------|
| 01                | 03       | 1D                        | BD                        | 00                           | 02                           | 52 43                |

Response:

| Device<br>address | Function | Number<br>of bytes | Val | ue from<br>1DBD | the regi<br>(7613) | ster | Valu | ue from<br>1DBE |    | ster | Check-<br>sum<br>CRC |
|-------------------|----------|--------------------|-----|-----------------|--------------------|------|------|-----------------|----|------|----------------------|
| 01                | 03       | 08                 | 3F  | 80              | 00                 | 00   | 40   | 00              | 00 | 00   | 42 8B                |

#### Record of values into the register (code 06h)

The function is accessible in the publication mode.

Example: record of the register of 1DBDh (7613) address in RTU

Request:

| Device<br>address | Function | Register<br>address<br>Hi | Register<br>address<br>Lo | Valu | ue from<br>1DBD | the reg<br>(7613) |    | Check-<br>sum<br>CRC |
|-------------------|----------|---------------------------|---------------------------|------|-----------------|-------------------|----|----------------------|
| 01                | 06       | 1D                        | BD                        | 3F   | 80              | 00                | 00 | 85 AD                |

Response:

| Device<br>address | Function | Register<br>address<br>Hi | Register<br>address<br>Lo | Valu | ue from<br>1DBD | the reg<br>(7613) |    | Check-<br>sum<br>CRC |
|-------------------|----------|---------------------------|---------------------------|------|-----------------|-------------------|----|----------------------|
| 01                | 06       | 1D                        | BD                        | 3F   | 80              | 00                | 00 | 85 AD                |

#### Record into n-registers (code 10h)

The function is accessible in the publication mode

Example: record of two registers beginning from the register with 1DBDh (7613) address in RTU mode.

Request:

| Device<br>address | Function |    | ister<br>ress<br>Lo |    | ber of<br>sters<br>  Lo | Number<br>of bytes |    |    | he reg<br>(7613 |    |    | e for t<br>DBE |    | gister<br>I) | Check-<br>sum<br>CRC |
|-------------------|----------|----|---------------------|----|-------------------------|--------------------|----|----|-----------------|----|----|----------------|----|--------------|----------------------|
| 01                | 10       | 1D | BD                  | 00 | 02                      | 08                 | 3F | 80 | 00              | 00 | 40 | 00             | 00 | 00           | 03 09                |

Response:

| Device<br>address | Function | Register<br>address<br>Hi | Register<br>address<br>Lo | Number of<br>registers<br>Hi | Number of<br>registers<br>Lo | Check-<br>sum<br>(CRC) |
|-------------------|----------|---------------------------|---------------------------|------------------------------|------------------------------|------------------------|
| 01                | 10       | 1D                        | BD                        | 00                           | 02                           | D7 80                  |

#### Report identifying devices (code 11h) in RTU mode

**Example:** Data readout identifying the device for NA5 with a universal input.

Request:

| Device<br>address | Function | Checksum<br>(CRC) |
|-------------------|----------|-------------------|
| 01                | 11       | C0 2C             |

Response:

| Device<br>address | Function | Number<br>of bytes | Device<br>identifier | Device<br>state | Field depending on the type of device | Check-<br>sum |
|-------------------|----------|--------------------|----------------------|-----------------|---------------------------------------|---------------|
| 01                | 11       | 08                 | 81                   | FF              | 00XXXXX                               |               |

| Device address                        | - depending on the setpoint  |  |  |  |  |
|---------------------------------------|--|--|--|--|--|
| Function                              | - no of function 0x11  |  |  |  |  |
| Number of bytes                       | - 0x08   |  |  |  |  |
| Device identifier                     | - 0x81   |  |  |  |  |
| Device state                          | - 0xFF   |  |  |  |  |
| Field depending on the<br>device type | - XXXXXX   |  |  |  |  |
| Device name                           | - no taken advantage in NA5 meters, 00 X X X X X   |  |  |  |  |
| Analogue output                       | <ul> <li>field depending on the type of the analogue output</li> <li>0x00 - lack of analogue output, X 00 X X X X</li> <li>0x01 - voltage analogue output, X 01 X X X X</li> <li>0x02 - current analogue output, X 02 X X X X</li> </ul> |  |  |  |  |
| No. of the software                   |  |  |  |  |  |
| program                               | - software version implemented in the meter<br>- X X4 - byte variable of float type  |  |  |  |  |
| Check sum                             | <ul> <li>2 bytes in case of work in RTU mode</li> <li>1 byte in case of work in ASCII mode</li> </ul>  |  |  |  |  |

#### Example:

Work in **RTU** mode: e.g. **Mode = RTU 8N2** (value 0x02 in case of readout/record through the interface). **NA5** meter

Execution with a voltage analogue output: 00, No. of the software version: 1.00, Device address set on: Adr = 0 x 01,

For such a meter the frame has the following form:

| Device<br>address | Function | nction Number Device<br>of bytes identifier |    | Device Field depending on the state device type |                   | Check-<br>sum<br>(CRC) |
|-------------------|----------|---|----|---|-------------------|------------------------|

1) In case of registers no occurring in the given meter series, their values is 1E+20

# Note !

- At the moment of exceeding the upper or lower range, "displayed value", "minimum", "maximum" parameters are set on the value 1E+20.
- For the parameter Cnt=0 (Measurement switching off and display of the current time), "minimum", "maximum" and "displayed value" parameters are set on the value 1E+20.

### Description of the Status 1 register

#### Bit-15... 9 No used

### Bit-8 Error of the conductor resistance compensation

- 0 lack of error
- 1 signalling of the compensation error

## Bit-7... 5 Position of the decimal point

- 000 lack
- 001 000.0
- 010 00.00
- 011 0.000
- 100 Auto

### Bit-4 Signalling of the upper range exceeding

- 0 normal work
- 1 range exceeding

## Bit-3 Signalling of the lower range exceeding

- 0 normal work
- 1 range exceeding

## Bit-2 Individual characteristic

- 0 individual characteristic switched off
- 1 individual characteristic switched on

# Bit-1...0 Kind of output (voltage, current)

- 00 lack of analogue output
- 01 current
- 10 voltage

## Description of the status 2 register

### Bit-15. No used

# Bit-14...13 Record of measurement results in memory

- 0 Recording switched off
- 1 Recording switched on

### Bit-12 State of alarm 8

- 0 off
- 1 on

## Bit-11 State of alarm 7

- 0 off
- 1 on

# 8. BEFORE A FAILURE WILL BE DECLARED

In case of incorrect symptoms please to acquaint with the table below.

| SYMPTOMS   | PROCEDURE  |
|--|--|
| 1. Lack of indications on the display. The<br>bargraph indicates nothing.  | Check the connection of the feeder cable.  |
| 2. The time is displayed on the display,<br>e.g. <b>H_12</b> alternately with <b>34:43</b> .   | The number of measurements <b>Cnt</b> = 0 has been introduced. The meter is working in the SLEEP mode. It displays the current hour.   |
| 3. Marks or  | Check the correctness of the input signal connec-<br>tion. See the service manual. Check also the setting<br>of parameters <b>D_P</b> , <b>Ind</b> , <b>LoIn</b> and <b>Hiln</b> .   |
| <ol> <li>A signal inconsistent with our<br/>expectations occurs on the meter<br/>analog output.</li> </ol>   | One must check if the load resistance of the ana-<br>logue output is in accordance with technical data.<br>Check if the individual characteristic is not switched<br>on. In case of necessity make changes of individual<br>characteristic parameters or introduce manufacturer<br>parameters <b>Set</b> .   |
| <ol> <li>Lack of possibility to enter into the<br/>programming mode. The inscription<br/>Err is displayed.</li> </ol>  | The programming mode is protected by a password.<br>When the user forgets which password has been<br>introduced, he should contact by phone the manu-<br>facturer or the nearest authorised workshop.  |
| <ol> <li>Lack of certainty if all segments of the<br/>display or bargraph are efficient.</li> </ol>  | Enter into the programming matrix and switch the display and bargraph <b>tSt</b> test on.<br>Character fields are lighted successively from 0000 to 9999. In the same time the bargraph is lighted with successive colours. If some of segments are not lighted or diodes have different colours, one must submit these defects to the nearest workshop. |
| <ol> <li>During the operation in the pro-<br/>gramming mode, parameter values<br/>inconsistent with the range of changes<br/>given in the table 1, appear on the<br/>display.</li> </ol> | Enter into the programming matrix and accept the <b>SEt</b> parameter. The meter will introduce values in accordance with the table 2.   |

| <ol> <li>A result inconsistent with our expecta-<br/>tions appears on the display.</li> </ol>   | Check if the individual characteristic is not switched<br>on. In case of necessity enter into the programming<br>matrix and accept the <b>SEt</b> parameter. The meter will<br>introduce parameters in accordance with the table 2.  |
|---|--|
| <ol> <li>The bargraph does not work in accor-<br/>dance with our expectations.</li> </ol>   | Check bargraph parameters. In case of a further<br>incorrect operation, enter into the programming<br>matrix and accept the parameter <b>SEt</b> .<br>Switch the display and bargraph <b>tSt</b> test on.  |
| <ol> <li>Despite the exceeding of the alarm<br/>threshold the alarm relay does not<br/>switch on.</li> </ol>                                    | Check the delay of alarm operation introduced into the meter. In case of need, correct the <b>dLY</b> parameters.  |
| 11. The meter, instead of displaying the<br>measurement result, displays the<br>parameter symbol and its value.                                 | The meter is working in the preview mode or in the programming mode. Press the escape key .  |
| <ol> <li>Despite of the introduced delay in the<br/>alarm operation, e.g. 30 seconds, the<br/>alarm after this time did not operate.</li> </ol> | The lasting alarm state was shorter than the programmed, that means that during the lasting time, the alarm withdrawal state occurred. In such a case, the meter begins to count down the time from the beginning.   |
| <ol> <li>The meter does not establish the<br/>communication with the computer<br/>through the RS-485 interface.</li> </ol>                      | Check if interface conductors ( <b>A</b> , <b>B</b> , <b>GND</b> ) were<br>correctly connected. Then, check in the program-<br>ming matrix the setting of the interface ( <b>bAud</b> , <b>trYb</b> ,<br><b>Adr</b> ). These parameters must be the same as in the<br>used software. |

# 9. EXAMPLES OF NA5 METER PROGRAMMING

## Example 1. Programming of the individual characteristic.

If we want to programme so that to the value 4.00 mA will correspond the value 0 on the display, whereas the value 100, to the value 20.00 mA, one must:

- enter into the programming mode and choose the D\_ P parameter responsible for the decimal point. Set the decimal point on 00000
- choose the Ind parameter and switch the individual characteristic On
- choose the I\_H1 parameter and introduce the value 4.00
- transit on the d\_Y1 parameter and introduce the value 0
- transit on the I\_H2 parameter and introduce the value 20.00
- transit on the d\_Y2 parameter and introduce the value 100

# Example 2 Programming of an inverse individual characteristic.

If we want to programme so that to the value 4.00 mA will correspond the value 120.5 on the display, and the value 10.8, to the value 20.00 mA, one must:

- enter into the programming mode and choose the D\_P parameter responsible for the decimal point. Set the decimal point on 0000.0
- choose the Ind parameter and switch the individual characteristic On
- choose the I\_H1 parameter and introduce the value 4.00
- transit on the d\_Y1 parameter and introduce the value 120.5
- transit on the **I\_H2** parameter and introduce the value 20.00
- transit on the d\_Y2 parameter and introduce the value 10.8

# Example 3 Programming of the alarm with hysteresis

If we want to programme the alarm 1 operation so that at the value 850°C, this alarm will be switched on, whereas it will be switched off at the value 100°C, and the alarm 2 operation so that at the value 1000°C this alarm will be switched off and switched on at the value -199°C, one must:

- enter into the programming mode, choose the PrL parameter of the alarm 1 and introduce the value 100
- transit on the PrH parameter of the alarm 1 and introduce the value 850
- transit on the tYPA parameter of the alarm 1 and choose select the function assigned as nor
- enter into the programming mode and choose the **PrL** parameter of the alarm 2 and introduce the value 1000
- transit on the PrH parameter of the alarm 2 and introduce the value -199
- transit on the tYPA parameter of the alarm 2 and select the function nor

# Example 4 Programming of an alarm operating in a set interval with delay.

If we want that the alarm 1 will be switched on in the interval from 100 V to 300 V and operate only after 10 seconds, one must:

- enter into the programming mode, choose the PrL parameter of the alarm 1 and introduce the value 100
- transit on the **PrH** parameter of the alarm 1 and introduce the value 300
- transit on the **tYPA** parameter of the alarm 1 and select the function **On**
- transit on the dLY parameter of the alarm 1 and introduce the value 10.0

in case of the alarm state duration for a time longer than 10 seconds, the meter will switch the alarm relay on

## Example 5 Programming of an analog output

If we want to programme so that to the displayed value 0.00 mA will correspond the value 4.00 on the analogue output, whereas to the value 20.00 mA, the value 20.00 mA, one must:

- enter into the programming mode, choose the IndO parameter and switch the individual characteristic On
- choose the **d\_H1** parameter and introduce the value 0.00
- transit on the **O\_Y1** parameter and introduce the value 4.00
- transit on the **d\_H2** parameter and introduce the value 20.00
- transit on the O\_Y2 parameter and introduce the value 20.00

## Example 6 Bargraph programming

If we want to programme so that the bargraph was of a ,,sector" type - red colour between PrL and PrH parameters, one must:

- enter into the programming mode, choose the tYPb parameter of the bargraph and choose SEct
- choose the coLr parameter of the bargraph 1 and choose r

### Example 7 Programming a bargraph with a "magnifier"

If we want to programme so that the bargraph was blank for the value 0 and full lighted for the value 150, one must:

- enter into the programming mode , choose the **brL** parameter of the bargraph and introduce the value 0
- choose the **brH** parameter of the bargraph 1 and introduce the value 150

### Example 8 Programming of recording every 20 sec from 12:30

- enter into the programming mode, choose the Go\_r parameter and introduce the value 12:30,
- transit into IntE parameter and introduce the value 00:00:20,
- choose the **rEc** parameter and switch the recording in **On**,
- after exiting from the programming matrix, the memory will be erased and the meter will begin recording results evry 20 sec, from 12:30.

After filling the memory, the recordingwill be switching off.

# **10. ORDERING PROCEDURE**

Table 5

| NA5 METER WITH BARGRAPH   | x | X      | X | X      | X | X      | x | X | ΧХ | х |
|---|---|--------|---|--------|---|--------|---|---|----|---|

| otes: <sup>*)</sup> In the meter without displays, o  |   |        |   |        |   |        |   |   |    |   |

#### Notes:

\*\*) The manufacturer assigns the execution code.

\*\*\*) Available execution with self-locking sockets.

### Example of NA5 ordering:

#### Code: NA5 M G U 1 1 4 1 0 00 8 means:

- M NA5 meter with two 7-colour bargraphs,
- G digital LED displays of green colour,
- U universal input (table 6),
- 1 current analogue output signal 0/4...20 mA,
- 1 RS-485 digital output signal,
- 4 additional outputs consisting of 4 relays,
- 1 supply: 95...253 V a.c./d.c.,
- 0 socket-screw plug terminals,
- 00 standard execution,

. . . .

8 - without a quality inspection certificate.

In case of a custom-made execution or if you need some more additional technical information, please write to or phone our Export Department.

| Input signals |                         | Table 6         |  |  |  |  |
|---------------|-------------------------|-----------------|--|--|--|--|
| Universal     | Resistance thermometer: |                 |  |  |  |  |

Table 6

# **11. MAINTENANCE AND GUARANTEE**

The NA5 meter does not require any periodical maintenance. In case of some incorrect unit operations:

## 1. From the shipping date, during the period given in the annexed guarantee card

One should take the meter down from the installation and return it to the Manufacturer's Quality Control Dept.

If the unit has been used in compliance with the instructions, the Manufacturer guarantees to repair it free of charge.

## 2. After the guarantee period:

One should turn over the meter to repair in a certified service workshop.

The disassembling of the housing causes the cancellation of the granted guarantee.

Spare parts are available for the period of five years from the date of purchase.

The Manufacturer policy is one of continuous improvement and we reserve the right to make changes in design and specification of any products as engineering advances or necessity requires and revise the above specification without notice.
